# The Deck Demon

## Getting Started

To maintain the integrity of your deck structure during construction, begin removing boards from the outside (away from the building) and work towards the building.

Only remove 4 to 6 boards at a time and replace them with new decking. This will ensure you maintain the square spacing of the frame. You have two techniques for removing inline boards – Photos A & B.

## Removing Decking

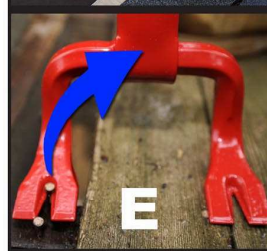

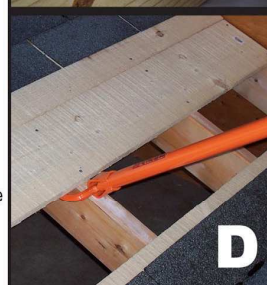

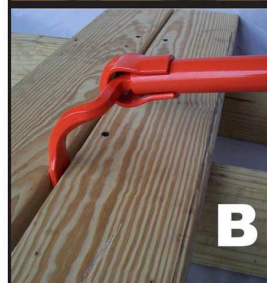

Slide the Deck Demon™ under the decking and pry up. For wide decking that you want to remove undamaged, pry up one side slowly and then slide the Deck Demon™ further under the board and pry up the other fasteners (C & D).

## Pull Nails

From a standing position, wedge the catspaw around the fastener head and either roll the Deck Demon™ back and pull the nail or pry the nail out by pulling the Deck Demon™ to the side as shown in photo E.

## New Deck Boards

When replacing the deck boards, first install a skirt board so the new decking will extend 3/4" of an inch off the frame. This will greatly decrease the chance that new fasteners will fall into existing holes (from previous fasteners).

*Always wear proper eye, hand, and foot protection.  
Be sure to work from a safe and stable position.*
